

Professional AC Core Cutting Business Website

Production UI/UX System • v1.0

PRODUCT	Local service / lead-generation website
PRIMARY USERS	Homeowners, tenants, AC installers, contractors and businesses
PRIMARY GOAL	Generate qualified calls, WhatsApp enquiries and quote requests
DESIGN DIRECTION	Modern • Premium • Industrial • Trustworthy
PRIMARY ACTIONS	Get a Quote • WhatsApp • Call Now
PRIMARY DEVICE	Mobile-first with full desktop support

Design principle: premium, not flashy. The interface should make the service, proof of work, service area and contact actions obvious within seconds.

Prepared from the approved Project Brief, PRD v1.0, TRD v1.0 and the supplied reference-design analysis.

1. Product & UX North Star

The website is a local-service conversion product, not a brochure. Every major screen should help a visitor answer four questions quickly: What do you do? Can I trust you? Do you serve my area? How do I contact you?

The approved product vision calls for a trustworthy, fast and conversion-focused experience that feels like an established local service brand rather than a generic template.

UX Priority	Design Decision	Success Signal
Clarity	State AC core cutting / wall drilling and the service location early.	Visitor understands the service immediately.
Trust	Use real work photography, approved reviews, equipment and verified business information.	Visitor continues exploring instead of leaving.
Conversion	Keep Call, WhatsApp and Quote actions prominent.	More qualified contact actions.
Local relevance	Make service areas and local intent visible without fake location content.	Visitor knows whether service is available.
Speed	Prioritize fast rendering, optimized imagery and restrained client-side JS.	Strong mobile performance / Core Web Vitals.
Accessibility	Keyboard support, clear labels, contrast, focus states and large touch targets.	Usable across devices and assistive technologies.

Core funnel

Discover → Understand service → See real work → Check services/reviews/FAQ → Confirm service area → Call / WhatsApp / Quote → Business follow-up

2. Information Architecture & Navigation

The information architecture follows the finalized product and technical documents. Public routes are simple, descriptive and SEO-friendly.

Route	Purpose	Primary UX Role
/	Home	Immediate positioning + conversion
/services	Services overview	Service discovery
/services/ac-core-cutting	AC Core Cutting	Primary service intent
/services/rcc-core-cutting	RCC Core Cutting	Secondary service intent
/services/ac-drain-hole	AC Drain Hole	Service intent
/services/concrete-wall-drilling	Concrete Wall Drilling	Service intent
/services/pipe-cable-passage	Pipe & Cable Passage	Service intent
/services/other	Other Services	Additional services
/about	About	Trust / business story
/gallery	Gallery	Proof of real work
/reviews	Reviews	Social proof
/faq	FAQ	Objection handling
/service-areas	Service Areas	Local relevance
/contact	Contact	Lead conversion

Desktop navigation

Logo | Home | Services | About | Gallery | Reviews | FAQ | Service Areas | Contact | Get a Quote

Mobile navigation

Logo | Menu button. The menu exposes all primary routes plus clear WhatsApp and Call Now actions. On-page mobile conversion also uses a persistent bottom action bar.

Navigation behavior

- Header remains visually stable and may become sticky on scroll.
- Active route is visibly indicated.
- Mobile menu is keyboard accessible and closes predictably.
- Avoid deep navigation: important services and contact actions should be reachable in a few taps.
- Footer repeats key service links, contact information and service-area context.

3. Visual Design System

The supplied reference analysis establishes a blue/white, clean, professional service-brand direction. The system below adapts those principles into an original AC core-cutting identity rather than copying the reference brand or imagery.

Token	Value	Use
Primary Navy	#0F3557	Headings, primary buttons, strong UI
Secondary Blue	#25658A	Secondary actions, links, accents
Accent Blue	#4EA3D1	Highlights, icons, active states
Light Blue	#DCEFF8	Callouts, soft section backgrounds
Background	#F7FAFC	Main page background
White	#FFFFFF	Cards, navigation, content surfaces
Primary Text	#142536	Body / high-emphasis text
Muted Text	#64748B	Supporting text
Border	#DCE4EA	Dividers, input borders, cards

Typography

Element	Desktop	Mobile	Weight / Notes
H1	64–72 px	42–48 px	700–800; short, high-impact
H2	42–48 px	32–36 px	700
H3	24–28 px	21–24 px	650–700
Body	16–18 px	15–17 px	400; ~1.6 line-height
Small	13–14 px	13–14 px	400–500
Button	14–16 px	14–16 px	600–700

Recommended typeface: Plus Jakarta Sans. Poppins is an acceptable alternative if branding or implementation constraints require it.

4. Layout, Spacing & Responsive Rules

The interface should use generous whitespace, a strong grid and consistent alignment. Visual density should remain comfortable on mobile and desktop.

System	Desktop	Tablet	Mobile
Max content width	1200–1280 px	100% minus margins	100% minus 20–24 px
Page side padding	32–48 px	24–32 px	20–24 px
Section vertical space	88–120 px	72–96 px	56–72 px
Grid gap	24–32 px	20–24 px	16–20 px
Card radius	16–20 px	16–20 px	14–18 px
Image radius	20–28 px	18–24 px	16–20 px
Button radius	10–12 px	10–12 px	10–12 px
Touch target	≥44 px	≥44 px	≥44 px

Responsive breakpoint intent

- Mobile: single-column content, prominent CTAs, compact navigation and sticky contact actions.
- Tablet: two-column cards where useful; preserve readable line lengths.
- Desktop: two-column hero, multi-card service grids and wider gallery compositions.
- Do not let desktop layouts become oversized on medium screens.
- Avoid horizontal scrolling and preserve comfortable tap targets.

Content hierarchy rule

Every section should have one clear primary message. Supporting text, imagery and CTAs should reinforce that message rather than compete with it.

5. Home Page — Detailed UI/UX

The homepage is the primary conversion surface. It should communicate the service and location immediately, then build trust through proof before presenting the strongest contact opportunity.

Order	Section	UX Purpose	Primary Content
01	Header	Orientation	Logo, nav, Get a Quote
02	Hero	Immediate understanding	AC core cutting headline, copy, Call/WhatsApp/Quote
03	Trust strip	Fast confidence	Accuracy, equipment, reliable service
04	Services	Discovery	Six service cards
05	How It Works	Reduce uncertainty	Contact → Discuss → Site/job details → Cutting → Completion
06	Recent Work	Proof	Real project images
07	Reviews	Social proof	Approved testimonials / public review path
08	FAQ preview	Objection handling	Top customer questions
09	Service Areas	Local confidence	Main city + genuinely served areas
10	Final CTA	Conversion	Call / WhatsApp / Request Quote
11	Footer	Utility	Navigation, contact, legal/basic business info

Hero wireframe

DESKTOP: Left 48% — eyebrow / H1 / supporting copy / primary and secondary CTAs. Right 52% — large real core-cutting image. Target visual height: roughly 600–700 px.

MOBILE: H1 → supporting copy → Get a Quote / WhatsApp → real work image. The first screen should make the service and primary action obvious without requiring a long scroll.

Hero content rule

Preferred message structure: **WHAT WE DO** → **WHY IT MATTERS** → **WHAT TO DO NEXT**. Example positioning: “Professional AC Core Cutting” followed by a concise explanation of clean, accurate wall openings for AC installation.

6. Services UI/UX

Services are both a discovery surface and an SEO surface. The overview should be scannable; individual pages should answer the customer's practical questions and end in a contact action.

Service card anatomy

- Service image or relevant visual.
- Service name and short summary.
- Small directional cue such as “Learn More →”.
- Entire card can be clickable, with an accessible named link.
- Avoid unsupported claims such as guaranteed speed, exact pricing or certifications unless verified.

Service	Card message	Detail page sections
AC Core Cutting	Clean wall openings for AC installation requirements.	What it is / When needed / Process / Benefits / Work photos / FAQ / CTA
RCC Core Cutting	Core cutting for genuine RCC requirements.	Use case / Process / Benefits / Photos / FAQ / CTA
AC Drain Hole	Opening for AC drain/water passage where required.	Use case / Process / Photos / FAQ / CTA
Concrete Wall Drilling	Professional drilling for relevant installation needs.	Use case / Process / Benefits / Photos / CTA
Pipe & Cable Passage	Wall openings for pipes and electrical cable routing.	Use case / Process / Photos / FAQ / CTA
Other Services	Additional verified services offered by the business.	Service-specific content / Photos / CTA

Service detail page flow

Hero → What is this service? → When is it required? → Process → Benefits → Relevant work photos → FAQ → Contact CTA

7. About, Gallery & Reviews

These pages are primarily trust-building surfaces. Physical service businesses need visible evidence that real work is being performed.

About page

- Business story and experience, based only on information supplied by the owner.
- Equipment and working approach.
- Real team/work imagery where available.
- Trust-focused language without unverifiable claims.
- Clear Contact / WhatsApp CTA.

Gallery page

- Use real project images whenever possible.
- Categories: All, AC Core Cutting, RCC Cutting, Drain Holes, Completed Work (adapt to actual content).
- Use responsive image optimization and meaningful alt text.
- Before/after presentation only when genuine paired images exist.
- Avoid stock images if they could be mistaken for the business's own work.

Gallery interaction

Desktop: responsive masonry-like or balanced grid. Mobile: two-column or single-column depending on image ratio. Optional lightbox can be used only if it does not materially hurt performance or accessibility.

Reviews page

- Display only approved customer testimonials.
- Distinguish manually entered testimonials from reviews sourced from a public platform.
- Show source/date/rating only when genuinely available.
- Provide a public review profile path when available.
- Never manufacture testimonials.

8. FAQ, Service Areas & Contact

These sections remove the final friction between intent and enquiry.

FAQ UX

- Keyboard-accessible accordion.
- One question per row with a clear expand/collapse indicator.
- Concise customer-friendly answers.
- Questions should address real uncertainty: what core cutting is, hole size requirements, RCC capability, expected duration and service availability.
- FAQ structured data only where appropriate and based on visible, accurate content.

Service Areas UX

Show the main city first, then nearby locations genuinely served. Individual local landing pages should only be created where useful and truthful. A map/location block can reinforce local confidence.

Contact page layout

Block	UI Treatment	Goal
Phone	Large clickable phone CTA	Immediate contact
WhatsApp	Large WhatsApp action	Fast enquiry
Quote form	Short form with clear labels	Written lead capture
Location	Address/service area + map support	Local confidence
Hours	Visible when supplied	Expectation setting
Form feedback	Loading / success / safe error	Reduce uncertainty

9. Quote Form & Conversion UX

The form should collect only information useful to the business. The approved TRD suggests name, phone, WhatsApp preference, service type, location and message.

Recommended form layout

Name → Phone → WhatsApp preference → Service type → Location → Message → Submit Request

Field	Required?	UX Rule
Name	Yes	Short text; clear label
Phone	Yes	Validate format server-side
WhatsApp preference	Optional	Simple yes/no or preference control
Service type	Yes	Select from actual services
Location	Yes	City/area only unless more detail is genuinely needed
Message	Optional	Short free-text field with sensible maximum length

States

- Default: clear labels and helpful field hints.
- Focus: visible keyboard/mouse focus state.
- Validation: specific, plain-language error directly associated with the field.
- Submitting: disable duplicate submission and show a concise loading state.
- Success: confirm the enquiry was received and present optional Call / WhatsApp next steps.
- Failure: safe generic message; never expose internal errors.

Conversion principle: the form is an alternative to calling, not a barrier before calling. Keep phone and WhatsApp available.

10. Component Library

The component system should make the website easy to maintain and expand as new services, locations, reviews and gallery items are added.

Component	Responsibilities	Variants / Notes
Header	Logo, navigation, primary CTA	Desktop / mobile
MobileMenu	Accessible mobile navigation	Open / closed
Hero	Headline, copy, image, CTAs	Home / service
CTAButton	Primary contact action	Quote / WhatsApp / Call
ServiceCard	Service preview	Image / compact
TrustSection	Verified trust points	3-card or inline
ProcessSteps	How It Works	5-step flow
GalleryGrid	Real work media	Category filters optional
ReviewCard	Approved testimonial	Source-aware
FAQAccordion	Expandable answers	Accessible keyboard behavior
ContactForm	Lead capture	Validation / states
ServiceAreaList	Genuine locations	List / grouped
MapBlock	Location support	Embed / external map
Footer	Utility and business links	Desktop / mobile

Component behavior rule

Prefer reusable components with content passed as data. Keep business content centralized where practical so adding a service or gallery item does not require redesigning the interface.

11. Interaction, States & Micro-UX

Motion should support hierarchy rather than distract. The reference analysis recommends a premium-but-subtle interaction language.

Element	Default	Hover / Focus	Active / Feedback
Primary CTA	Navy fill, white text	Slight lift / shadow	Pressed state; loading if submitting
Secondary CTA	White/light surface + border	Accent border/text	Pressed state
Service card	Neutral surface	Translate ~4 px + modest shadow	No exaggerated motion
Nav link	Muted/dark text	Accent/underline	Active route indicator
FAQ row	Collapsed	Subtle background cue	Expanded answer + icon rotation
Input	Bordered	Focus ring	Error/success state as applicable

Approved motion vocabulary

- Fade-up content reveal.
- Small image reveal.
- Subtle card hover.
- Button/icon micro-movement.
- Header transition on scroll.
- Respect reduced-motion preferences.

Avoid

- Heavy 3D effects.
- Particle backgrounds.
- Full-screen loading animations.
- Large parallax scenes.
- Animation that delays access to contact actions.

12. Mobile-First UX Specification

Mobile is the primary device context in the approved PRD. The mobile experience should be treated as the reference layout, not a reduced desktop version.

Persistent bottom action bar

- Keep the bar compact and high contrast.
- Do not cover form controls, important content or cookie/consent UI if any is later introduced.
- Use clear labels, not icon-only controls.
- Ensure adequate bottom spacing so page content is never hidden behind the bar.

Mobile homepage priority

Priority	What the user should see / do
1	Recognize AC core cutting / wall drilling service.
2	Understand the local service context.
3	See Call / WhatsApp / Quote options.
4	See proof of real work.
5	Explore services and reviews.
6	Confirm service area.
7	Convert.

13. Accessibility & Inclusive Interaction

The interface should follow practical WCAG-aligned patterns as required by the PRD/TRD.

Area	Requirement
Semantics	Use semantic HTML and logical heading hierarchy.
Keyboard	Navigation, accordions and forms must work without a mouse.
Focus	Visible focus states must be preserved.
Forms	Every input has an accessible label; errors are understandable and associated with the field.
Images	Meaningful alt text for informative images; decorative images treated appropriately.
Contrast	Text and controls must remain readable against their backgrounds.
Targets	Buttons and links have clear names and adequate touch targets.
Motion	Avoid unnecessary motion and respect reduced-motion preferences.

Accessibility is part of the visual system, not a final QA-only task.

14. SEO-Aware UX

UI/UX decisions should support the approved local SEO strategy without turning the site into a keyword-stuffed experience.

UX Surface	SEO/Content Rule
Page titles	Unique and descriptive per indexable page.
Headings	Semantic hierarchy; one clear page purpose.
Internal links	Connect services, service areas, gallery/reviews and contact naturally.
Service pages	Useful service-specific content rather than thin location pages.
Images	Descriptive alt text; optimized responsive media.
Structured data	LocalBusiness / Service and other relevant structured data using verified information.
Crawl files	Sitemap and robots.txt present and valid.
Social metadata	Open Graph/Twitter-style metadata for clean sharing.
Location content	Only genuine service areas should be represented.

Example title structure

Homepage: **AC Core Cutting Services in [City] | [Business Name]**

Service: **AC Core Cutting in [City] | [Business Name]**

Exact business name, city and service-area terms remain implementation dependencies and must be supplied by the business owner.

15. Photography & Content Direction

The supplied design analysis strongly favors real photography because authenticity is central to trust for this service category.

Photo Type	Preferred Subject	UX Placement
Hero	Real core-cutting machine + wall + completed opening / worker performing work	Homepage hero
Process	Drilling/cutting process	How It Works / service pages
Equipment	Actual equipment used by business	Trust / About
Completed work	Finished holes and clean results	Gallery / Recent Work
Before / After	Genuine paired job images	Gallery
Team / owner	Real people involved in the service	About / trust

Image handling

- Compress before upload and use responsive image sizing.
- Use modern formats where supported.
- Lazy-load below-the-fold images where appropriate.
- Protect hero/LCP imagery from becoming unnecessarily heavy.
- Write descriptive alt text that describes the image rather than stuffing keywords.

Content authenticity rule: do not use stock or AI-generated work imagery in a way that could be mistaken for the business's actual work.

16. Conversion UX & Analytics Events

The TRD specifies conversion tracking so future marketing and reporting can distinguish meaningful actions.

Event	Triggered when	UX surface
phone_click	User activates a phone CTA	Header / hero / sticky bar / contact
whatsapp_click	User activates WhatsApp CTA	Header / hero / sticky bar / contact
quote_start	User begins the quote flow	Quote form
quote_submit	Valid quote is submitted	Quote form
map_click	User opens map/location action	Contact / service areas
service_cta_click	User selects a service CTA	Service cards / detail pages

Analytics should remain privacy-conscious and should not collect unnecessary sensitive information.

17. UI/UX QA Checklist

The following checklist translates the approved requirements into a design-review gate before development is considered complete.

- Service and local context are understandable within seconds on the homepage.
- Call, WhatsApp and Get a Quote actions are visible and functional.
- Mobile sticky actions do not obstruct content.
- All approved routes are reachable through navigation or contextual links.
- Service cards and detail pages have consistent hierarchy.
- Real gallery images are correctly optimized and labeled.
- Reviews are approved and correctly attributed.
- FAQ accordion is keyboard accessible.
- Contact form has labels, validation, loading, success and safe error states.
- Service-area content represents only genuine locations.
- Typography hierarchy is consistent across breakpoints.
- Contrast and focus states are visible.
- No excessive animation or decorative interaction harms performance.
- Desktop, tablet and mobile layouts have been reviewed.
- Hero image and other major media do not create avoidable LCP issues.
- No placeholder business information remains at launch.

18. Final UI/UX Deliverables

The UI/UX phase should hand development a clear, reusable system rather than a collection of disconnected screens.

Deliverable	Output
Design system	Colors, typography, spacing, radius, buttons, inputs, cards and states
Responsive rules	Mobile, tablet and desktop behavior
Navigation spec	Header, mobile menu, footer and route relationships
Homepage spec	Section order, hierarchy, CTA behavior and responsive composition
Service spec	Overview cards + reusable detail-page structure
Trust surfaces	About, Gallery, Reviews, FAQ and Service Areas
Conversion spec	Contact page, quote form and sticky mobile actions
Interaction spec	Hover, focus, active, loading, success, error and motion rules
Accessibility spec	Semantics, keyboard, focus, labels, contrast and target sizes
SEO-aware UX	Metadata/content hierarchy, internal linking and structured-data considerations
QA checklist	Cross-device and functional design acceptance checks

Implementation dependency

Before production launch, insert verified business name/logo, phone/WhatsApp, city, genuine service areas, actual services, experience, real work photos, approved testimonials, business hours/address and Google Business Profile/review URL where available.

This UI/UX specification intentionally keeps business-specific facts as implementation inputs rather than inventing them.

19. Design Lock — Final Direction

The design should be locked around one central idea:

“A professional local specialist who does real, accurate work and is easy to contact.”

Visual language

- Blue/white professional palette.
- Premium industrial feel without looking corporate or cold.
- Large, confident typography.
- Real photography as a trust asset.
- Generous whitespace and clean card surfaces.
- Subtle shadows, borders and micro-interactions.
- No excessive visual effects.

Experience language

Clear → Trustworthy → Local → Practical → Contactable

The reference design is used as a design-language inspiration only. The final website must have original branding, original content and imagery specific to AC core cutting and related services.
